

Measurement–context framework

Routine–care glucose records are transformed into context–specific GV summaries and outcome estimands

MIMIC–IV

date–anchored perioperative window
source–priority glucose series
day–1 landmark
30–day mortality; HR

INSPIRE

verified operation–end anchor
final retained glucose features
24–hour landmark
30–day mortality; HR

eICU–CRD

preserved aggregate context
all–source aggregate features
post–landmark frame
hospital mortality; RR

Each context changes one or more observed dimensions; no database is a validation hierarchy

source
composition

sampling
opportunity

exposure
window

time anchor
and landmark

outcome and
effect type

Interpretation: a GV coefficient is an estimate attached to a measurement and analytic context, not a context–free biological constant.
